

Cyber Security Incident Management

What is Incident Management?

- Cyber Security incident management is a process used to be able to react to unplanned cyber security incidents.
- This process involves people, systems and processes working together quickly to be able to identify, analyse and resolve the incidents that are occurring.
- By having this process in place, it allows for efficient reactions to any threats companies can face by having a structured approach ready to respond.

What is an Incident?

A cyber security incident is an internal or external threat looking to compromise the confidentiality, integrity or availability of systems or data which could have severe consequences depending on the type of breach and incident. (Inger Anne Tøndel, et al., 2014)

Key Incident Responses:

Please see a generalised approach of the processes used to respond to incidents:

- **Triage:** This stage is used to determine how severe the incident is and who needs to be alerted.
- **Analysis:** A more thorough investigation takes place on the data that is relevant to the incident to learn more about how to react.
- **Contain/Mitigate:** Aim of this part is to prevent the attacker from being able to carry out more damage.
- **Remediate/Eradicate:** This step is the concluding step of understanding the attack which leads to a permanent removal of the incident.
- **Recover:** Implement necessary changes to improve the security and ensure the system is functioning normally.
- **Review:** Review how the incident was handled and how the incident was possible. (Centre, 2019)
