

Cyber Security Incidents to be aware of

Denial of Service

- This type of incident breaches the shop's security and can cause parts or the whole website to be unavailable to the customers.
- This would breach the availability of the CIA triad and decreases the number of sales they would be able to make especially because they have no physical stores.

Ransomware

- This incident would mean that the shop would lose control of the website and unable to gain control again until they pay the attacker's ransom.
- This incident breaches all of the CIA triad due to the site being unavailable, attackers accessing confidential information and altering the integrity of the data. (Cullen, 2018)

Improper Usage

- Improper Usage of company resources could be a malicious inside threat or accidental misuse which leaves the shop open to breaches and incidents.
- Depending on the type of incident, this has the potential to breach all three of the CIA triads. (Fleming, et al., 2014)

Phishing

- Multiple types of phishing can be used to target any of the employees at a small online company which may be more vulnerable with a smaller IT team.
- Can breach all the CIA triad but specifically confidentiality due to the attacker tricking people to disclosing confidential shop information.

Data Breaches

- This incident would involve the shop's web server being breached through unauthorised methods of access.
- Can breach all 3 CIA triad but specifically breaches confidentiality and integrity by being able to manipulate and access confidential data.
