

Ransomware Incident Response Plan

- Ransomware is the type of cyber security incident that the online retail shop is most at risk of because this incident can exploit human and system vulnerabilities which would lead to all CIA triads being breached.
- Ransomware accessing confidential company and customer records would lead to expensive fines and ransoms to pay to get their website back under control which is why playbooks are important.
- Playbooks are structured, pre-planned steps agreed by members of the CSIRT and are used when facing a type of cyber security incident to ensure the damage is contained and recovered from as quickly as possible. (Onwubiko & Ouazzane, 2020)

Ransomware Playbook

1. Preparation

- Ensure all people involved know their roles and responsibilities.
- Consistently checking monitoring tools for any breaches.

2. Containment/Analyse

- Due to the company being small it should be easier to spot the vulnerabilities being exploited which should lead to malicious addresses being blocked for example.
- However, if not found quickly then precautions need to be taken due to the large number of customers they have.

3. Eradication

- Once the incident has been contained and analysed, the incident must be removed from the shop's system.
- All steps should have been recorded and need to be concluded for the shop to reflect.

4. Recover/Reflect

- Return shop back to normal service.
- Upon reflection and recovering, identify the reason how the incident occurred.
- If the shop has the budget, implement changes to ensure the same incident can't occur the same way. (Whalley, et al., 2024)
